

SAFETY VALVE Spring and Open Design

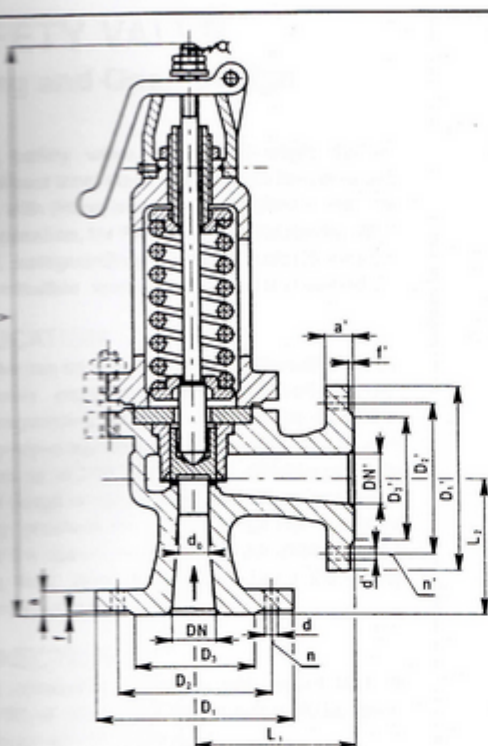

Spring, safety valve, open and angle design, made of carbon steel, of the same inlet and outlet DN, with lifting lever for inspection under the valve operation, for PN40 and temperatures up to 300°C, safeguarding pressure vessels against the permissible working pressure increasing.

APPLICATION

The valve can be used for pressure vessels and other pressure equipment, their settled working pressure safeguarding. Working fluids may be steam, air, nonaggressive liquids and gases with PN40 and temperatures up to 300°C. The lowest opening pressure for all DN is 0,3 bar. It can be used at the space, where partial penetration of the working fluid, along the spring, during the safety valve blow is not harmful. The limitation of opening pressures with regard to working temperature is as follows:

- 40,0 bar for temperatures up to 200 °C
- 32,0 bar for temperatures up to 300 °C

Opening pressures in accordance with the spring design are given in the size table.

CONNECTION

Flange connection diameters with raised face of shape "B", at inlet PN40 and at outlet PN16, are in accordance with EN 1092-2.

MATERIAL

The main parts are made of carbon steel. Parts, ensuring the reliable valve function are made of stainless steel. The spring is made of special spring steel.

NOTE

- The guaranteed discharge coefficient for liquids is: $\alpha_w = 0,25$
- The guaranteed discharge coefficient for gases is: $\alpha_w = 0,25$

$P_{0 \max}$ - max. opening pressure (bar)
